transcription factor 1, neural - rat

N'Alternate names: neural zinc finger factor-1

C;Species: Rattus norvegicus (Norway rat)

C;Decies: 18-Feb-2000 #sequence_revision 18-Feb-2000 #text_change 09-Jul-2004

C;Accession: T46637

R;Jiang, Y.; Yu, V.C.; Buchholz, F.; O'Connell, S.; Rhodes, S.J.; Candeloro, C.; Xia, Y.F.

J. Biol. Chem. 271, 10723-10730, 1996

A;Title: A novel family of Cys-Cys, His-Cys zinc finger transcription factors expressed i A;Reference number: A58210; MUD:96210003; PMID:8631881
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A;Description: binds specifically to a cis-regulatory element of the beta-retinoic acid e nervous system and in the pituitary gland C;Keywords: DNA binding; transcription factor

NAB3 protein - yeast (Saccharomyces cerevisiae)

NAB4 protein - yeast (Saccharomyces cerevisiae)

NyAlternate names: probable RNA/ssDNA-binding protein HMD1; protein P1945; protein YPL19

C;Species: Saccharomyces cerevisiae

C;Date: 10-Sep-1999 #sequence revision 10-Sep-1999 #text_change 09-Jul-2004

C;Accession: S48529; 865209; 650122

R;Wilson, S.M.; Oberdorf, A.M.; Datar, K.V.; Swedlow, J.R.; Paddy, M.R.; Swanson, M.S.

The invention relates to a method of determining the angiogenic index of a tissue or cell sample comprising assessing, in a sample, the expression trevals of one or more differentially-expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the angiogenic index. The methods and compositions of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the angiogenic index of a tissue or cell sample using expression levels of differentially expressed genes, useful for diagnosing or treating cancer, coronary artery disease, myocardial ischemia and/or arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 23; SEQ ID NO 44; 296pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2003-731502/69.

The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein sequence of the invention.

Novel 2495 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers

Claim 1; SEQ ID NO 3633; 2449pp; English.

Novel human protein sequence #1445

07-OCT-2004

ADQ66472;

```
This invention relates to a novel isolated polynucleotide comprising a nucleotide sequence selected from one of 1680 sequences, a mature protein coding portion of them, an active domain of them and their complementary sequences. The invention may be useful for the production of compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           51 SSTQIMVKTNMYHNEKVNPHVECKDYVKKAKVKINPVQQSRPLLSQIHTDAAKENTCYCG 110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SQKKEEHNYSLFVSDNLGEQPTKCSPEEDEEDVDDEDHDEGFGSEHELSENEEEEEE 230

The present invention relates to novel human coding sequences (ABQ99268-CC ABQ99608) and proteins (ABP64682-ABP65022). The sequences are useful in therefield of molecular biology as hybridisation probes, primers for used in the field of molecular biology as hybridisation probes, primers for protein, or in generation of anti-sense DNA or RNA. The polymucleotides are useful in diagnostics as expressed sequence tags (ESTS) for identifying expressed genes or for physical mapping of the human genome. The proteins may be used as molecular weight markers, or as nutritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or pluripotential state.

CC sequil for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The polymuclocides and proteins are useful for preventing, treating or ameliorating disorders involving aberrant protein expression or biological activity, e.g. haematopoietic disorders, central/peripheral curvical, bacterial or fungal infection, autoimmume disorders, allergic reactions and conditions, coagulation wite assembled from ESTS collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases, collated mainly by sequencing by hybridisation, and in some cases.
                                                                                                                                                                                                                                                                                                                                                   Human, expressed sequence tag; EST; haematopoietic disorder; central nervous system disease; viral infection; peripheral nervous system disease; non-healing wound; infectious disease; immune deficiency; immune disorder; bacterial infection; allergy; cancer; fungal infection; antionimume disorder; coagulation disorder; nootropic; antiallergic; antiinflammatory; immunosuppressive; neuroprotective; cytostatic; haemostatic; virucide; antibacterial; fungicide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             V, Zhang J, Zhao QA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide, useful in research, diagnostic or therapeutic methods, e.g. preventing or treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tang YT, Goodrich RW, Liu C, Zhou P, Asundi V

The invention relates to a method of determining the angiogenic index of a tissue or cell sample comprising assessing, in a sample, the expression levels of one or more differentially-expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the angiogenic index. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating cancer, coronary artery disease, myocardial ischemia or coronary artery disease, myocardial ischemia or coronary artery disease, myocardial ischemia or coronary artery disease, myocardial ischemia or coronary artery disease, myocardial ischemia or coronary or oronary or or also be used in research, drug discovery and forensic medicine involving angiogenesis. This sequence corresponds to one of the differentially expressed proteins of the invention. %%66666666688%%

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 20; SEQ ID NO 59634; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a

The present invention describes a method for detecting a stress that alters a functional interaction of a low density lipoprotein (LDL) (Teceptor binding protein (I) with an LDL receptor interaction domain (II). The method involves introducing a predetermined stress into a system which provides a stress-biased physical interaction of (I) with (II), where in the absence of the stress, the system provides an unbiased interaction of (I) and (II), and detecting the stress-biased interaction of (I) and (II), where a difference between BI and UI indicates that the stress alters the interaction of (I) and (II). (I) is selected from SEMCAP-1, JIP-1, PSD-95, JIP-2, Tallin, OMP25, CAPON, PIP4,5 Kinase, Na channel brain 3, Mintl, ICAP-1 and APC subunit 10. The method is useful for detecting a stress that alters functional interaction of LDL receptor

ö polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at Itp.wipo.int/pub/published_pct_sequences Low density lipoprotein receptor binding protein; signal transduction; LDL receptor signalling pathway. Detecting stress that alters interaction of LDL receptor binding polypeptide with LDL receptor interaction domain, comprises detecting difference in stress-biased and unbiased interaction of peptide and Gaрв ö Length 160; 0; Indels 601 29 NLLFVINSIKQEIVNRVQNPRDERGPNMGQKLEILIKDTL 68 562 NLLFVINSIKQEIVNRVQNPRDERGPNMGQKLEILIKDTL 6.3%; Score 40; DB 4; Lo 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (AAH62689), predicted transcript sequences (AAH62689-AAH62839) and concoded proteins (AAG84910-AAG85051) and oligomucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral agene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides the primary nucleotide sequence of the WSBV genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transgenic viral resistant shrimp. (Updated on 06-AUG-2003 to correct OS
binding polypeptide with LDL receptor interaction domain. The method is useful for detecting and modulating signal transduction through LDL receptors. ABB04778 to ABG04909 represent LDL receptor binding proteins which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               virus

The nucleic acid monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp. which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic and sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for detecting soft tissue sarcoma
                                                                                                                                                                                                                                                                                                                                               Barly detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cyclin-dependent kinase modulation biomarker SEQ ID NO 418.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for identifying a candidate p53 pathway modulating agent, which comprises: (a) providing an assay system comprising a mp53 (modulator of p53) polypeptide or nucleic acid or its fragment or derivative; (b) contacting the assay system with a test agent conditions where the system provides a reference activity except in the presence of the test agent; and (c) detecting a test agent-biased activity, where a difference between the test agent as a candidate p53 pathway modulating agent; and secribed: (1) modulating the p53 pathway in a mammalian cell; and (3) diagnoshing a disease in a patient. MP53 has cytostatic activity, and can be used in gene therapy. The method is useful for identifying a candidate p53 pathway modulating agent for preparing a composition for diagnosing or treating e.g., cancer. The present sequence represents a human MP53 protein, which is useful the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.

This invention describes a novel method of predicting or determining whether a mammal will respond or is responding to an anti-cancer agent that medulates cyclin-dependent kinase (cdk) activity. The method comprises measuring the level of one or more biomarkers selected from 2774 biomarkers given in the specification (nuclectide sequence SEQ ID No:1246 (Genbark EST W38729) is especially preferred). The method of the invention is utilized in a kit for determining or predicting whether patient would be susceptible or resistant to treatment by an agent modulating cdk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed against the biomarkers and a cell culture model to identify biomarkers. The cdk modulator is preferably N-5-[[5-(1,1-Dimethylethyl)-2-coxazolyl]methyllthio]-2-thiazolyl-4-piperidine carboxamide, 0.5-L-taratric acid salt. Note: The sequence data for this patent did not form the the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.init/pub/published pct sequences. This sequence represents a biomarker used in the method of the invention.
                                                                       Biomarkers useful for predicting or determining the response of a mammal to a cancer treatment comprising administration of a modulator of cyclin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Biomarkers useful for predicting or determining the response of a mammal to a cancer treatment comprising administration of a modulator of cyclindependent kinase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This invention describes a novel method of predicting or determining whether a mammal will respond or is responding to an anti-cancer agent that modulates cyclin-dependent kinase (cdk) activity. The method comprises measuring the level of one or more biomarkers selected from 2774 biomarkers given in the specification (nucleotide sequence SEQ ID NO:1246 (Genbank EST W28729) is especially preferred). The method of the invention is utilized in a kit for determining or predicting whether patient would be susceptible or resistant to treatment by an agent modulating cdk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed against the biomarkers and a cell culture model to identify biomarkers. The cdk modulator is preferably N-5-[[5-1,1-1]methylethyl].2-
oxazolylmethyllthiol-2-thiazolyl-4-piperidine carboxamide, 0.5-L-taratic acid salt. Note: The sequence data for this patent did not form tartaric acid salt. Note: The sequence data for this patent did not form directly from WIPO at ftp. wipo.int. publypublished pot sequences. This sequence represents a biomarker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               atypical zinc finger, testis, human; tumour, BAZ1-beta; BAZ2-alpha, drug;

This sequence represents the human BAZ1-beta protein, a member of

```
CC family of transcriptional regulator genes containing a bromodomain (BAZ, CC Bromodomain with Atypical Zinc finger) which are expressed specifically CC in testis tissue and also in certain tumour lines. Transgenic cells may CC be used for the preparation of the BAZ1-alpha, BAZ1-beta, BAZ2-alpha and CC BAZ2-beta proteins. These proteins can be used in the treatment of cancer cC and other proliferative disorders, and in screening of compounds for CC their binding ability to the expression products (e.g. for use as drugs CC by modulation of transcriptional regulation)

XX Sequence 1527 AA;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Seq
